STEREO Sonification Project

D. Bithell, R. Morales,
L. M. Peticolas, N. Craig

Space Sciences Laboratory (SSL)
Center for New Music and Audio Technologies (CNMAT)
University of California in Berkeley

STEREO Meeting
Berkeley, CA - December 18, 2004

Aims of the Project -

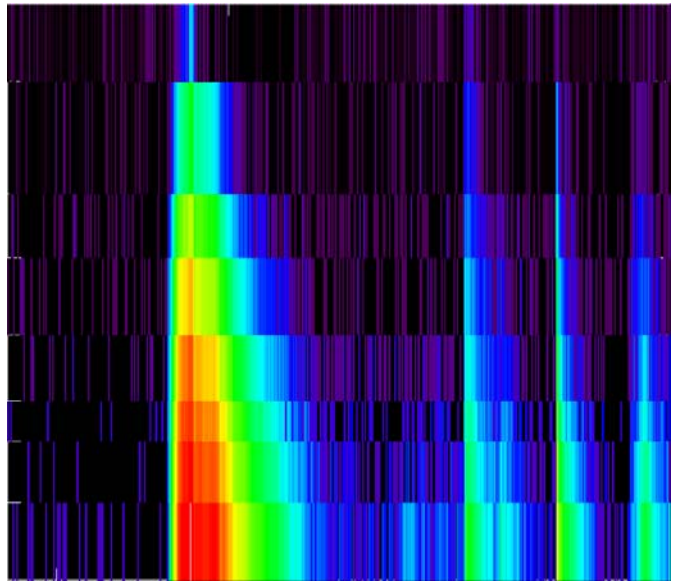
Science: create sonic representations of data and find new approaches to displaying multi-channel, multi-source data (like STEREO)

Education: create new methods of introducing and interacting with key concepts in science and music

Music: create tools for creative exploration of sound using solar data as a rich generative material

Examples

Science: A computer realization of carbon flux



Music: An excerpt from Roberto Morales' orchestral composition "Turning Point" incorporating scaled Helios data

- **Sonification** - mapping data into sound

How closely does the sonification represent the physical reality of the data?

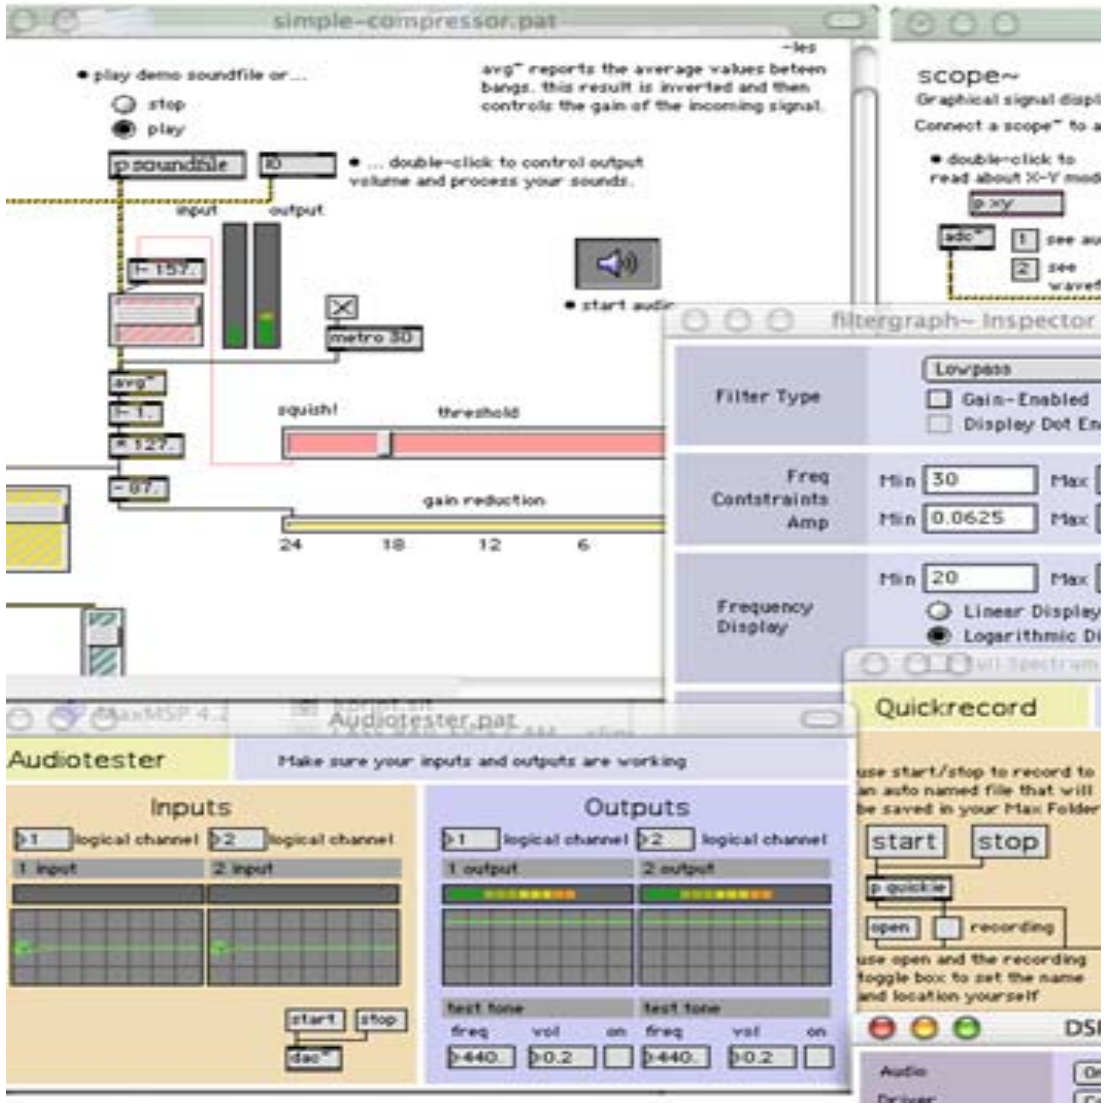
-There is always a degrees of **abstraction** and **arbitrariness** in the mapping

-Issues of **musical perception** and cognition

-The "**Art of Mapping**"

Max/MSP Programming Environment

Graphical object oriented programming language designed for real-time processing and coordination of musical and multimedia events.



Description of the Data Structure
(Spectrogram Color Analysis)

Using image file types (.jpeg, .gif, etc.):

-RGB and HSL color values are used to scale parameters of sonic processing

-Easy to manage data in multiple formats

-Able to automatically reconfigure processing based on the number of bins (y-axis) and length of the data (x-axis)

Types of Processing:

"Physical Modeling”

- Frequency Scaling of Sine Waves
- Amplitude Scaling of a Harmonic Spectrum

"Arbitrary Modeling”

- Granular Synthesis
- Frequency Modulation synthesis
